Men Without Work - Nicholas Eberstadt 2016-09-12

By one reading, things look pretty good for Americans today: the country is richer than ever before and the unemployment rate is down by half since the Great Recession—lower today, in fact, than for most of the postwar era. But a closer look shows that something is going seriously wrong. This is the collapse of work—most especially among America’s men. Nicholas Eberstadt, a political economist who holds the Henry Wendt Chair in Political Economy at the American Enterprise Institute, shows that while “unemployment” has gone down, America’s work rate is also lower today than a generation ago—and that the work rate for US men has been spiraling downward for half a century. Astonishingly, the work rate for American males aged twenty-five to fifty-four—or “men of prime working age”—was actually slightly lower in 2015 than it had been in 1940: before the War, and at the tail end of the Great Depression. Today, nearly one in six prime working age men has no paid work at all—and nearly one in eight is out of the labor force entirely, neither working nor even looking for work. This new normal of “men without work,” argues Eberstadt, is “America’s invisible crisis.” So who are these men? How did they get there? What are they doing with their time? And what are the implications of this exit from work for American society? Nicholas Eberstadt lays out the issue and Jared Bernstein from the left and Henry Olsen from the right offer their responses to this national crisis. Hollywood Chemistry - Sidney Perkowitz 2014-02-01

Hollywood and science have found each other, and seem to have formed the strongest bond to date. The increasing use of science consultants in science fiction and science-themed productions, from comedies like *The Big Bang Theory* to dramas like *Breaking Bad*, as well as the creation of the Science and Entertainment Exchange by the National Academy of Sciences, suggests a new level of interaction between science and entertainment media that will surely benefit both sides. What finally catalyzed this reaction? This eclectic collection of essays examines the connections between Hollywood and science, with a primary focus on the current state of the relationship. It features contributions from screenwriters, producers, directors, scientists, science advisors, science writers, even a music composer and a dramaturge. The formats of the chapters contained herein are equally eclectic: some take the form of academic journal articles, some are written as less formal interviews, and some are narratives. The tones of the offerings range from the purely serious to the comedic. The first half of the book focuses on the various approaches that different television series and movies employ to incorporate accurate science into their productions. In other instances, authors

explore the more fundamental aspects of science-like sound, music, and light-that enable audiences to appreciate television and film. The second half of the volume explores the effects that television and film have on the viewing public. Some authors explain the science, both explicit and implied, that can be found within various Hollywood productions, and explore instances where Hollywood and science failed to click, instead of meshing. Other authors examine the influence that Hollywood science has on the science community, public policy, and the legal system. Still others describe pedagogical applications of television and movie science to education-as well as Hollywood's role in motivating future generations of scientists and engineers.

Highlights in Bioorganic Chemistry - Carsten Schmuck 2006-01-24

This is a fascinating introduction to the topic. Spanning the spectrum of nucleic acid chemistry, carbohydrates, peptides, molecular recognition, biosynthesis and natural biosynthesis, right up to medical and biophysical chemistry, the book provides advanced students and those already working in the field with a balanced overview. In more than 30 contributions, a new generation of recognized scientists gives an account of the latest research in such areas as * Artificial receptors for the stabilization of β -sheet structures * Carbohydrate recognition by artificial receptors * Combinatorial chemistry as a tool for the discovery of catalysts * The interaction of NO and peroxynitrite with hemoglobin and myoglobin * Inhibitors against human mast-cell-tryptase as a potential approach to conquering asthma * The selectivity of DNA replication. A readily accessible survey for everyone wishing to stay abreast of developments. With a Foreword by Ronald Breslow.

Selecting Instructional Materials - National Research Council 1999-12-17

The National Science Education Standards set broad content goals for teaching grades K-12. For science teaching programs to achieve these goals—indeed, for science teaching to be most effective—teachers and students need textbooks, lab kits, videos, and other materials that are clear, accurate, and help students achieve the goals set by the standards. *Selecting Instructional Materials* provides a rigorously field-tested procedure to help education decisionmakers evaluate and choose materials for the science classroom. The recommended procedure is unique, adaptable to local needs, and realistic given the time and money limitations typical to school districts. This volume includes a guide outlining the entire process for school district facilitators, and provides review instruments for each step. It critically reviews the current selection process for science teaching materials—in the 20 states where the state board of education sets forth a recommended list and in the 30 states where materials are selected entirely by local decisionmakers. *Selecting Instructional Materials* explores how purchasing decisions are influenced by parent attitudes, political considerations, and the marketing skills of those who produce and sell science teaching materials. It will be indispensable to state and local education decisionmakers, science program administrators and teachers, and science education advocates.
